Driver Safety Management Solution

This solution is a safety management system for drivers working with transportation companies to prevent accidents. It measures health conditions through camera image analysis when drivers register for work and leave work through a tablet camera. Healthcare measurements are provided through analysis with bio-signals extracted from face images, and alcohol sensors can even check the driver's drinking.

Core Technology

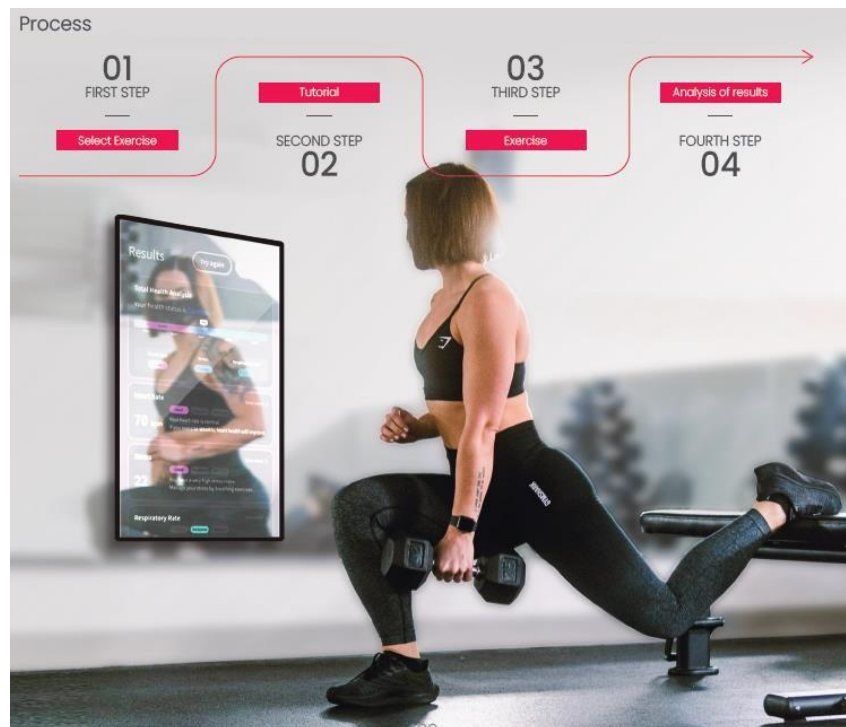

Our technology allows users to easily measure various health information (Blood pressure, Heart rate, Stress, Respiratory rate, etc.) using only the camera to manage their health.

Tablet App

Smart Mirror Fitness Solution

The pulse measurement accuracy of our solution is more than 98 percent compared to optical sensors and ECG sensors. This accuracy is very close to that of a medical device. And the pulse pattern is analyzed through our technology, allowing us to monitor blood pressure, heart rate, stress, respiratory rate, etc.
